

The Natural History Museum Presents

FAVORITE FUNGI: I ♥ ROT

Why are some logs in the forest crumbling into piles of reddish brown, while others are light as a feather? Why are some white, blue, and others still look like regular wood? Fungi are breaking down, changing it, and often making tasty mushrooms out of it. Let's explore the world of wood rot!

**Friday,
November 13th**

6:30-8:30 PM

Maria Morrow is a professor of botany and environmental science at College of the Redwoods. She studied fungal genetics and forest pathology at U.C. Berkeley.
